

## Biofuels are not necessarily organic

The assessment method used in greenhouse gas emissions in the Kyoto Protocol is flawed - alert researchers from Michigan State University. In their opinion, if you do not enter the amendment, these rules may result in more environmental harm than good.

The whole confusion is a result of excessive optimism with which treats the production of so-called biofuels. The authors of the work, published today in the journal Science, say that the current methods of calculation can be contrary to the intentions lead to cutting of trees and provide for growing biofuel crops on land that now used for food production. Biofuel production also can harm the environment, because they are way more or less dangerous. You can not allow this to continue all biofuels were regarded as organic, no matter how they are produced. During the climate conference in Copenhagen will be high time to introduce amendments.
