

Scientists have found a way to melanoma?

Chances for an effective method to combat melanoma, a dangerous and difficult to treat skin cancer. Canadian researchers from the University of Alberta, managed to create a substance that may prove very effective factor in the fight against melanoma.

Until now, the skin cancer very reluctantly give up chemotherapy. Existing drugs are effective in less than a quarter of the cases, and only for a limited time. Chances are that a new substance called Permelorit-A, the resistance break. First tests indicate that it may be much more effective and - equally important - much less toxic to patients. Work on the placed on the market yet will last, but the light in the tunnel have already seen. In the latest issue of "Newsweek" you read about Peter Duesbergu - a controversial scholar who was 30 years ago as the first to show that genes are the cause of cancer, and now changed his mind.
